## Cameras on Raspberry PI, Odroid and NVidia TX

S.Geißler - 2019-10-01 - General

You can use Raspberry PI 4, Odroid and NVidia TX as well as on x86 based platforms for our cameras. The USB cameras are UVC compatible (or can be made by firmware update), thus v4l2 is used, the GigE cameras use the Aravis library at

<https://github.com/AravisProject/aravis>

For a start please have a look at <https://github.com/TheImagingSource/tiscamera> . The Aravis library is included.

At <https://github.com/TheImagingSource/Linux-tiscamera-Programming-Samples> you will find additional programming samples.

Limitation: Older Raspberry PIs can not be used with GigE cameras, because they do not have an GigE Network interface. The USB 37U and USB 2 cameras can be used with these older ones.
